

V-Brace Connection

Attach the V-Brace to the Trace Ring so that the straps are equal in length and form a ***VERY*** tight connection between the V-brace and the Hasp ring on the harness.

Adjust the straps when **NOT** attached to the harness...They are adjusted properly when you are **JUST** able to get them connected to the Hasp rings.

This prevents the 2DH from being pulled forward by the stronger dog...and putting stress on the bolt.

It **ALSO** prevents the weaker dog from being pushed backwards by the 2DH when the stronger dog pulls harder. I.e. it keeps them equal.
